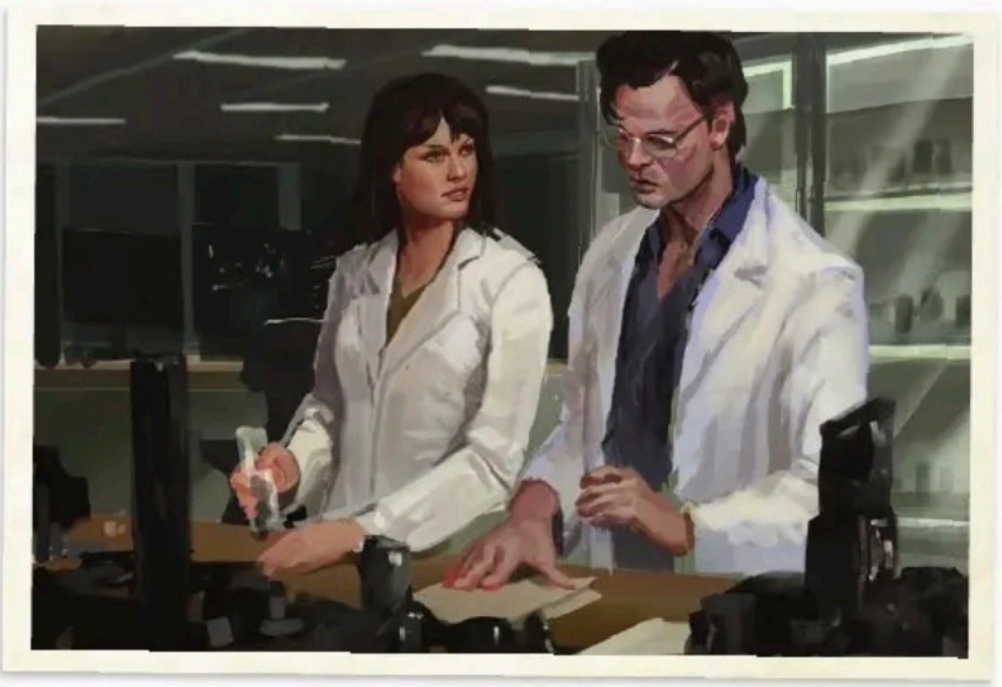
Banner, Bruce & Ross, Elizabeth

Project Status Update:
End of Fiscal Year Grant Requirement


To our mysterious benefactors, this year has been extremely fruitful. As we all know, one of the driving factors for this project was the elimination of malignant brain tumors caused by exposure to radiation. Additionally, we hoped our research could be the long-sought remedy for neurodegenerative diseases. We believe we are ready to move on to human trials. To push our understanding, we need to study the effects of our treatment on the human nervous and circulatory systems. Simulations have shown a 100% effectiveness in resistance to all levels of radiation. In fact, the benefits of the synthesized serum could strengthen the human immune system. Unfortunately, our simulations have been unable to accurately yield results on negating or granting immunity to cancerous tumors of the brain. We lack a patient with radiation exposure to the hippocampus to test our treatment on but are optimistic the results will be satisfactory.
